

ABSTRACT OF THE DISCLOSURE

In an ultrasonic wave utilizing device having a cylindrical elastic holder 2 into which an ultrasonic sensor 3 is pressed and a cylindrical part 23 that is closed at one end and is formed in a case 1 in such a way as to have this elastic holder 2 assembled therein, the elastic holder 2 has an elastic end wall 33 formed at an end of pressing side, a first elastic retaining part 35 for retaining the outside end edge of the cylinder part of the pressed-into ultrasonic sensor 3, and a second elastic retaining part 36, 37.
